ABSTRACT

Describe what your project presents within 150 words.

IndicSearch is a text analytics and keyword-based search engine designed for large Indian-language Wikipedia datasets. The project focuses on improving search efficiency by using data structures and indexing techniques to organize and retrieve information quickly. The system preprocesses the Wikipedia corpus and creates an efficient index for fast keyword searching. Users can search for a single keyword or multiple keywords and receive relevant documents ranked based on keyword frequency or occurrence. The system supports Unicode text, making it suitable for different Indian languages and large-scale datasets. By reducing the time required to scan the entire corpus for every query, the project demonstrates how efficient indexing and data structures can improve search performance and scalability. The project combines text processing, indexing, ranking, and efficient searching to provide a fast and practical solution for multilingual information retrieval.
